Border radius xml android studio. Android xml button border radius.

Sheetal Kumar Expert in PHP, MySQL, Android, Python, Javascript, React February 21, 2019 There are multiple ways of doing the same thing. You choose which way to go. Image by New18

The article covers how can we create a bottom sheet with round corners via XML and Canvas separately. Let's see what we're going to build. First, let's take the XML approach which is very straightforward to use. We simply create a rectangle shape with top left and right corners with some radius as follows. `background_curved_corners.xml` Then set this shape as a background to our container layout as follows `dialog_curved_corners.xml` So far so good and we're ready with our target. But we encounter an issue which you can easily spot in the image below. Bottom sheet with round corners We can see the black area outside of the curved corners. This issue we'll fix at the end of this article. But for now let's move on to our second approach which is using the canvas. So how can we have the same shape if we try to do this via custom drawing. Well! That is also quite easy to achieve but require some understanding of custom view drawing on canvas. In case you want to read more about it you can check out this article of mine. Now, we need to create a custom view with the same shape as our target. We'll use `LinearLayout` as our main container here. Go ahead and create the class `CurvedContainer.kt`. as follows: `CurvedContainer.kt` What are we doing here? We'll draw a path and paint the enclosed area of the path. Simple! Below image shows how the path actually looks like if we simply draw it using `stroke/border:path` with style `STROKE` The blue line indicates our path and the points indicates the position we're drawing our path on, in a linear clockwise fashion. We'll create the path once we know the size of our view i.e. in `onSizeChanged` function. `onSizeChanged` is evident that we're drawing our path step by step from one point to other and finally completing the path to the point P1 from where we started. This way we get our curved shape. And once we've our path ready, we'll draw it on our canvas in `onDraw` function as follows: We'll set this `CurvedContainer.kt` in our bottom sheet layout and the output will be the same as the XML approach output we saw above. We still have the gray area outside of our curved corners. To address our issue, we'll create a style as follows: We'll set this style to our bottom sheet dialog so that it won't draw any color to our custom view by setting the color background to transparent. `BottomSheetContainer.kt` We now have our target hit. You can try the same and see how it works. Hope it'll help! Until we meet again... Cheers! You don't need the separate fill item. In fact, it's invalid. You just have to add a solid block to the shape. The subsequent stroke draws on top of the solid.

Step 5: Now go to the `activity_main.xml` file and add an attribute to that `TextView`, for which you want to add rounded corners. The attribute is `android:background="@drawable/rounded_corner_view"`. Tip: Don't forget to replace your drawable resource file name if you have given a different name and you don't need to add xml extension after file name. Output UI: You can give your Android views and layouts rounded corners, borders, solid fill colors and even create circles by making a drawable and implementing it in XML. Rounded Corners with Transparent Inside Our first step is to create a new Drawable Resource File of type shape. To do that right click on drawable (under resources), choose New, choose Drawable Resource File. Name the resource `rounded_blue_border` and make the root element `shape`. `Android View > drawable > New > Drawable Resource File > shape` We will use the attributes `stroke`, `corners` and `padding`. The `stroke` determines the width and color of the border. The `corner radius` determines how curved the corners are. A smaller number makes them more square, a larger number more circular. The `padding` adds a blank space between a view and its contents. Less Rounded Corners To make less rounded corners reduce the radius in the Drawable Resource File. The example to the left has a corner radius of 15dp. BONUS: Rounded Button that Changes Color When Pressed Step 1: To create a button with rounded corners that changes color when pressed you need to create a new Drawable Resource File of type "selector." You can name it `rounded_button_selector`. The code below makes a yellow button that turns dark pink when pressed. BONUS: Making Circle It is simple to create a circle in Android Studio. There is no need to implement it programmatically. It is done entirely in XML. Step 1: Create a new Drawable Resource File name it circle. Make the root element `shape`. `Android View > drawable > New > Drawable Resource File > shape` The code below makes a dark pink oval. You have a lot of options now. You can create a background inside the circle. You can make it clickable (i.e. a circular button). You can give it elevation and thereby create a shadow. Explore what you can do and leave a comment with your favorite ideas.
